

Konstantin Fastov

Senior Backend Engineer - Blockchain Indexing & Data Pipelines

Moscow, Russia | UTC+3 | Open to remote roles and contract work

Email: kfastov@gmail.com | Telegram: [@kfastov](https://t.me/kfastov) | LinkedIn: [linkedin.com/in/kfastov](https://www.linkedin.com/in/kfastov) | GitHub: github.com/kfastov

SUMMARY

Senior backend engineer specializing in blockchain transaction ingestion and data pipelines in Rust and Go. Built EVM and Solana indexers, high-volume PostgreSQL storage, checkpointed recovery, backfills, parser workers, and API layers across private production systems and Ankr's multi-chain platform.

CORE SKILLS

- **Languages and runtimes:** Rust, Tokio, asynchronous and concurrent backend services; Go
- **Blockchain indexing:** EVM/Ethereum, Solana, transaction ingestion, parsing and indexing, token/NFT/balance data, reorg handling, internal EVM transaction indexing across node APIs
- **Pipeline design:** finalized-block streaming, checkpointed recovery, idempotent writes, bounded prefetch, worker queues, parser registries, backfills
- **Storage and interfaces:** PostgreSQL, FoundationDB, Redis, RabbitMQ, SQL; REST, JSON-RPC, gRPC, Protocol Buffers
- **Reliability and delivery:** deterministic regression tests, failure recovery, Linux production debugging, Docker, Kubernetes application deployments, Argo CD

EXPERIENCE

Rust Backend Engineer - Trading Systems

Confidential Crypto Trading Company | February 2025 - Present

- Designed and implemented a modular Solana transaction pipeline with finalized-block streaming, bounded prefetch, checkpointed recovery, batched idempotent PostgreSQL persistence, Redis-backed transaction bodies, parallel workers, and a per-program parser registry.
- Built a four-venue WebSocket market-data recorder backed by a 254 GB PostgreSQL store with approximately 981 million rows, plus backfill and data-integrity workflows for missing exchange history.
- Shipped Solana data-infrastructure changes covering Jupiter lookup-table recovery, Raydium pool ingestion, RPC reliability, and long-running cursor recovery after transient fetch failures.

Backend Developer - Go

Ankr | May 2022 - August 2024

- Built Go services for Ankr Advanced API, a 15+ service blockchain-data platform supporting 13+ EVM networks plus Solana.
- Built and maintained token, NFT, balance, and allowance indexers; added adaptive NFT request batching and returned Arbitrum block-fetch concurrency to reduce ingestion lag.
- Built DEX-liquidity price pathfinding up to three hops with price-history and route caching; parallelized per-token price fan-out, reducing peak balance lookup latency from 5+ seconds to approximately 100 ms.
- Made internal EVM transaction indexing work across Geth and Erigon node APIs, adding live capability checks and fallback node selection.
- Built Solana SPL-token balance and holder-count indexing plus a RabbitMQ-backed metadata-synchronization pipeline.
- Reworked the public JSON-RPC gateway's single-chain routing and evolved gRPC/Protocol Buffers contracts between the gateway and indexers.

Backend Developer - Node.js

Alfa Algorithms | August 2021 - May 2022

- Maintained and optimized a Node.js, MySQL, and Redis backend for a web trading platform and built its integration layer with a MetaTrader 4 server.
- Developed Solana governance programs in Rust, including validator-voting flows; deployed application workloads through Rancher/Kubernetes.

Backend Developer - Node.js

Sobix | May 2018 - August 2021

- Developed a WebTrader backend for forex brokers, adding trailing stops and real-time PnL calculations.
- Built Ethereum/Web3.js indexing for a custodial wallet and maintained a C++ MetaTrader server plugin.
- Integrated broker APIs, diagnosed production issues, and optimized Node.js/MySQL/Redis services used by trading terminals.

SELECTED PUBLIC WORK

- **OnlyDust-funded contributions | part-time | August 2024 - January 2025:** delivered 25 merged pull requests across 10 public Web3 repositories, spanning Rust and TypeScript tooling, Cairo contracts and tests, account abstraction, chain metadata, and cross-chain infrastructure.
- Implemented [SNIP-9 Outside Execution in starknet.js](#) and [numeric multicall inputs in starknet-foundry](#), taking both changes through upstream review with tests and documentation.
- Built [tgcli](#), an MTPROTO Telegram CLI with a durable local archive, a single-writer background service, machine-readable output, and an optional MCP interface.
- Added a [merged Sway compiler diagnostic](#) for Rust-style enum syntax, including targeted parser errors, actionable suggestions, and regression tests.

EDUCATION

Sevastopol National Technical University

Engineering Diploma in Information Systems and Technologies
