

Konstantin Fastov

Senior Rust Backend Engineer - Crypto Arbitrage & MEV Systems

Moscow, Russia | UTC+3 | Open to remote roles and contract work

Email: kfastov@gmail.com | Telegram: [@kfastov](https://t.me/kfastov) | LinkedIn: [linkedin.com/in/kfastov](https://www.linkedin.com/in/kfastov) | GitHub: github.com/kfastov

SUMMARY

Senior Rust backend engineer with eight years of experience in trading and blockchain infrastructure. Builds production crypto-arbitrage and MEV systems spanning cross-venue execution, hedging and reconciliation, deterministic backtesting, Solana transaction delivery, and RPC failure recovery; previously delivered Go blockchain APIs and indexers at Ankr and forex trading backends.

CORE SKILLS

- **Languages and runtime:** Rust, Tokio, asynchronous and concurrent backend services; Go
- **Arbitrage and execution:** funding-rate arbitrage, delta-neutral execution, maker/hedge state machines, partial-fill handling, compensating hedges, reduce-only closeout, position reconciliation, deterministic replay and backtesting
- **Solana and MEV:** Solana, Jito bundles, Jupiter address lookup tables, Raydium pools, transaction submission, RPC reliability
- **Data and service interfaces:** PostgreSQL, Redis, SQL; WebSocket, REST, JSON-RPC, gRPC, Protocol Buffers
- **Reliability and operations:** deterministic regression tests, randomized state-machine tests, failure recovery, Linux, production debugging

EXPERIENCE

Rust Backend Engineer - Trading Systems

Confidential Crypto Trading Company | February 2025 - Present

- Designed, built, and operated a Rust platform for cross-venue funding-rate arbitrage in perpetual futures; live trading covered 28 symbols on Binance USD-M and Hyperliquid, including a sustained two-week operating window.
- Built maker/hedge execution state machines with partial-fill handling, compensating hedges, reduce-only closeout, position reconciliation, deterministic replay, and backtesting.
- Improved reliability of a production Solana MEV platform spanning 10+ DEX protocols: added Jito bundle tracking and changed Jupiter lookup-table monitoring so transient RPC failures no longer stopped cursor progress.
- Implemented rate-limited and proxied Solana RPC clients, Raydium pool ingestion, transaction export, and bundle-profit calculation for arbitrage analysis and execution workflows.
- Implemented asynchronous integrations for Binance USD-M, Hyperliquid, Bybit, and Lighter, and built a four-venue WebSocket recorder backed by a 254 GB PostgreSQL store with approximately 981 million market-data rows.
- Currently rebuilding the platform around a strategy-agnostic Rust core so new venues and strategies share one model for instruments, events, execution, and market data.

Independent Open-Source Engineer - Web3 Infrastructure

OnlyDust-funded contributions | part-time | August 2024 - January 2025

- Delivered 25 merged pull requests across 10 public Web3 repositories, spanning Rust and TypeScript tooling, Cairo contracts and tests, account abstraction, chain metadata, and cross-chain infrastructure.
- Implemented [SNIP-9 Outside Execution in starknet.js](#) and [numeric multicall inputs in starknet-foundry](#), taking both changes through upstream review with tests and documentation.

EXPERIENCE CONTINUED

Backend Developer - Go

Ankr | May 2022 - August 2024

- Built Go services for Ankr Advanced API, a 15+ service blockchain-data platform supporting 13+ EVM networks plus Solana.
- Built DEX-liquidity price pathfinding up to three hops alongside token, NFT, balance, and allowance indexing; parallelized per-token price fan-out, reducing peak balance lookup latency from 5+ seconds to approximately 100 ms.
- Reworked the public JSON-RPC gateway's single-chain routing and evolved gRPC/Protocol Buffers contracts between the gateway and indexers.
- Made internal EVM transaction indexing work across Geth and Erigon node APIs, adding live capability checks and fallback node selection.

Backend Developer - Node.js

Alfa Algorithms | August 2021 - May 2022

- Maintained and optimized a Node.js, MySQL, and Redis backend for a web trading platform and built its integration layer with a MetaTrader 4 server.
- Developed Solana governance programs in Rust, including validator-voting flows; deployed application workloads through Rancher/Kubernetes.

Backend Developer - Node.js

Sobix | May 2018 - August 2021

- Developed a WebTrader backend for forex brokers, adding trailing stops and real-time PnL calculations.
- Built Ethereum/Web3.js indexing for a custodial wallet and maintained a C++ MetaTrader server plugin.
- Integrated broker APIs, diagnosed production issues, and optimized Node.js/MySQL/Redis services used by trading terminals.

SELECTED PUBLIC WORK

- Upstreamed [four merged changes](#) to Hyperliquid's official Rust SDK, resolving production payload and fill-schema mismatches, adding active-asset data, and stabilizing CI/toolchain behavior.
- Added a [merged Sway compiler diagnostic](#) for Rust-style enum syntax, including targeted parser errors, actionable suggestions, and regression tests.
- Contributed to and maintained a [World ID state bridge for Linea](#), spanning Solidity/Foundry contracts and tests, relay/deployment tooling, public testnet deployments, and security-review remediation.

EDUCATION

Sevastopol National Technical University

Engineering Diploma in Information Systems and Technologies
