

Konstantin Fastov

Senior Backend Engineer - Exchange & DEX Integrations

Moscow, Russia | UTC+3 | Open to remote roles and contract work

Email: kfastov@gmail.com | Telegram: [@kfastov](https://t.me/kfastov) | LinkedIn: [linkedin.com/in/kfastov](https://www.linkedin.com/in/kfastov) | GitHub: github.com/kfastov

SUMMARY

Senior backend engineer with eight years of experience building exchange connectivity, trading backends, and blockchain APIs. Current Rust work covers asynchronous venue integrations, market-data ingestion, normalized order and account lifecycles, and recovery from partial execution and stale state; earlier work includes Solana DEX infrastructure, multi-chain JSON-RPC services, and MetaTrader-integrated forex platforms.

CORE SKILLS

- **Languages and runtime:** Rust, Tokio, asynchronous and concurrent backend services; Go, Node.js
- **Exchange connectivity:** REST and WebSocket integrations, real-time market data, order and account lifecycles, funding-rate data, rate limiting, reconnects, backfills
- **Execution and recovery:** maker/hedge workflows, partial fills, compensating hedges, reduce-only closeout, position reconciliation, restart recovery
- **DEX and blockchain interfaces:** Solana RPC, Jito bundles, Jupiter address lookup tables, Raydium pools, EVM JSON-RPC, internal EVM transaction indexing
- **Data and operations:** PostgreSQL, Redis, SQL, gRPC, Protocol Buffers; deterministic regression tests, Linux, production debugging

EXPERIENCE

Rust Backend Engineer - Trading Systems

Confidential Crypto Trading Company | February 2025 - Present

- Implemented asynchronous integrations for Binance USD-M, Hyperliquid, Bybit, and Lighter, covering REST and WebSocket market data, order placement and updates, account events, positions, funding history, and operational recovery.
- Designed and operated cross-venue funding-rate execution in perpetual futures; live trading covered 28 symbols on Binance USD-M and Hyperliquid, including a sustained two-week operating window.
- Built maker/hedge execution state machines that recovered from partial fills, stale orders, failed execution, position drift, and restarts through compensating hedges, reduce-only closeout, and reconciliation.
- Built a four-venue WebSocket recorder backed by a 254 GB PostgreSQL store with approximately 981 million market-data rows, plus backfill and integrity workflows for missing exchange history.
- Added Jito bundle tracking, rate-limited and proxied RPC clients, Raydium pool ingestion, and resilient Jupiter lookup-table monitoring to a production Solana MEV platform spanning 10+ DEX protocols.
- Currently rebuilding the platform around shared venue contracts and normalized instrument, event, execution, and market-data models so new integrations do not require strategy-specific plumbing.

Independent Open-Source Engineer - Web3 Infrastructure

OnlyDust-funded contributions | part-time | August 2024 - January 2025

- Delivered 25 merged pull requests across 10 public Web3 repositories, spanning Rust and TypeScript tooling, Cairo contracts and tests, account abstraction, chain metadata, and cross-chain infrastructure.
- Implemented [SNIP-9 Outside Execution in starknet.js](#) and [numeric multicall inputs in starknet-foundry](#), taking both changes through upstream review with tests and documentation.

EXPERIENCE CONTINUED

Backend Developer - Go

Ankr | May 2022 - August 2024

- Built Go services for Ankr Advanced API, a 15+ service blockchain-data platform supporting 13+ EVM networks plus Solana.
- Reworked the public JSON-RPC gateway's single-chain routing and evolved gRPC/Protocol Buffers contracts between the gateway and indexers.
- Built DEX-liquidity price pathfinding up to three hops, with price history and route caching for assets without direct stablecoin pairs.
- Made internal EVM transaction indexing work across Geth and Erigon node APIs, adding live capability checks and fallback node selection.

Backend Developer - Node.js

Alfa Algorithms | August 2021 - May 2022

- Maintained and optimized a Node.js, MySQL, and Redis backend for a web trading platform and built its integration layer with a MetaTrader 4 server.
- Developed Solana governance programs in Rust, including validator-voting flows; deployed application workloads through Rancher/Kubernetes.

Backend Developer - Node.js

Sobix | May 2018 - August 2021

- Developed a WebTrader backend for forex brokers, adding trailing stops and real-time PnL calculations.
- Built Ethereum/Web3.js indexing for a custodial wallet and maintained a C++ MetaTrader server plugin.
- Integrated broker APIs, diagnosed production issues, and optimized Node.js/MySQL/Redis services used by trading terminals.

SELECTED PUBLIC WORK

- Upstreamed [four merged changes to Hyperliquid's official Rust SDK](#), resolving production payload and fill-schema mismatches, adding active-asset data, and stabilizing CI/toolchain behavior.
- Contributed to and maintained a [World ID state bridge for Linea](#), spanning Solidity/Foundry contracts and tests, relay/deployment tooling, public testnet deployments, and security-review remediation.
- Built [tgcli](#), an MTPROTO Telegram CLI with a durable local archive, a single-writer background service, machine-readable output, and an optional MCP interface.

EDUCATION

Sevastopol National Technical University

Engineering Diploma in Information Systems and Technologies
