

Konstantin Fastov

Senior Go Backend Engineer - Blockchain APIs & Data Services

Moscow, Russia | UTC+3 | Open to remote roles and contract work

Email: kfastov@gmail.com | Telegram: [@kfastov](https://t.me/kfastov) | LinkedIn: [linkedin.com/in/kfastov](https://www.linkedin.com/in/kfastov) | GitHub: github.com/kfastov

SUMMARY

Senior backend engineer with eight years of experience across blockchain data and trading systems, centered on Go APIs and infrastructure. Spent more than two years building production indexers, JSON-RPC routing, gRPC service contracts, pricing, and node-access services at Ankr; now applies the same systems experience to Rust transaction and market-data pipelines.

CORE SKILLS

- **Languages and runtimes:** Go; Rust and Tokio; TypeScript/Node.js; SQL
- **Backend and service interfaces:** asynchronous and concurrent services, REST, WebSocket, JSON-RPC, gRPC, Protocol Buffers, GraphQL
- **Blockchain services:** EVM/Ethereum, Solana, transaction indexing, reorg handling, internal EVM transaction indexing across node APIs, DEX-liquidity price pathfinding
- **Storage and messaging:** PostgreSQL, FoundationDB, Redis, MySQL, RabbitMQ
- **Reliability and delivery:** deterministic regression tests, failure recovery, Linux production debugging, Docker, Kubernetes application deployments, Helm, Argo CD

EXPERIENCE

Rust Backend Engineer - Trading Systems

Confidential Crypto Trading Company | February 2025 - Present

- Built a four-venue WebSocket recorder backed by a 254 GB PostgreSQL store with approximately 981 million market-data rows, plus backfill and integrity workflows for missing exchange history.
- Designed and implemented a modular Solana transaction pipeline with bounded asynchronous ingestion, checkpointed recovery, idempotent PostgreSQL persistence, Redis-backed transaction bodies, and parallel parsing workers.
- Improved reliability of production Solana infrastructure: added Jito bundle tracking and changed Jupiter lookup-table monitoring so transient RPC failures no longer stopped cursor progress.

Backend Developer - Go

Ankr | May 2022 - August 2024

- Built Go services for Ankr Advanced API, a 15+ service blockchain-data platform supporting 13+ EVM networks plus Solana.
- Reworked the public JSON-RPC gateway's single-chain routing and evolved gRPC/Protocol Buffers contracts between the gateway and indexers.
- Built and maintained token, NFT, balance, and allowance indexers; added adaptive NFT request batching and retuned Arbitrum ingestion concurrency to reduce lag.
- Built DEX-liquidity price pathfinding up to three hops and parallelized per-token price fan-out, reducing peak balance lookup latency from 5+ seconds to approximately 100 ms.
- Made internal EVM transaction indexing work across Geth and Erigon node APIs, adding live capability checks and fallback node selection.
- Authored Helm charts and shipped Kubernetes/Argo CD application deployments across seven locations.

Backend Developer - Node.js

Alfa Algorithms | August 2021 - May 2022

- Maintained and optimized a Node.js, MySQL, and Redis backend for a web trading platform and built its integration layer with a MetaTrader 4 server.
- Developed Solana governance programs in Rust, including validator-voting flows; deployed application workloads through Rancher/Kubernetes.

Backend Developer - Node.js

Sobix | May 2018 - August 2021

- Developed a WebTrader backend for forex brokers, adding trailing stops and real-time PnL calculations.
- Built Ethereum/Web3.js indexing for a custodial wallet and maintained a C++ MetaTrader server plugin.
- Integrated broker APIs, diagnosed production issues, and optimized Node.js/MySQL/Redis services used by trading terminals.

SELECTED PUBLIC WORK

- **OnlyDust-funded contributions | part-time | August 2024 - January 2025:** delivered 25 merged pull requests across 10 public Web3 repositories, spanning Rust and TypeScript tooling, Cairo contracts and tests, account abstraction, chain metadata, and cross-chain infrastructure.
- Implemented [SNIP-9 Outside Execution in starknet.js](#) and [numeric multicall inputs in starknet-foundry](#), taking both changes through upstream review with tests and documentation.
- Built [tgcli](#), an MTPROTO Telegram CLI with a durable local archive, a single-writer background service, machine-readable output, and an optional MCP interface.
- Contributed to and maintained a [World ID state bridge for Linea](#), spanning Solidity/Foundry contracts and tests, relay/deployment tooling, public testnet deployments, and security-review remediation.

EDUCATION

Sevastopol National Technical University

Engineering Diploma in Information Systems and Technologies
