SUMMARY

Senior backend engineer with eight years of experience building trading systems across crypto and forex. Combines production Rust execution, exchange connectivity, hedging, reconciliation, backtesting, and high-volume market data with earlier Node.js WebTrader platforms, MetaTrader 4 integration, broker APIs, real-time PnL, and C++ server-plugin work.

CORE SKILLS

- **Languages and runtimes:** Rust, Tokio, Node.js, TypeScript, JavaScript, Go, SQL; working C++
- **Trading systems:** crypto and forex execution, exchange connectivity, order lifecycles, maker/hedge workflows, partial-fill handling, position reconciliation, real-time PnL, trailing stops, deterministic replay and backtesting
- **Broker and market interfaces:** WebSocket market data, REST APIs, MetaTrader 4, WebTrader, broker integrations, C++ MetaTrader server plugins
- **Data and service interfaces:** PostgreSQL, Redis, MySQL; JSON-RPC, gRPC, Protocol Buffers
- **Reliability and operations:** deterministic regression tests, randomized state-machine tests, failure recovery, Linux, production debugging

EXPERIENCE

Rust Backend Engineer - Trading Systems

Confidential Crypto Trading Company | February 2025 - Present

- Designed, built, and operated a Rust platform for cross-venue funding-rate arbitrage in perpetual futures; live trading covered 28 symbols on Binance USD-M and Hyperliquid, including a sustained two-week operating window.
- Built maker/hedge execution state machines with partial-fill handling, compensating hedges, reduce-only closeout, forced-close safeguards, position reconciliation, deterministic replay, and backtesting.
- Implemented asynchronous integrations for Binance USD-M, Hyperliquid, Bybit, and Lighter, and built a four-venue WebSocket recorder backed by a 254 GB PostgreSQL store with approximately 981 million market-data rows.
- Added deterministic regression and randomized state-machine tests for production execution failures, including incomplete hedges, residual positions, retargeting, and restart recovery.

Backend Developer - Go

Ankr | May 2022 - August 2024

- Built Go services for Ankr Advanced API, a 15+ service blockchain-data platform supporting 13+ EVM networks plus Solana.

Backend Developer - Node.js

Alfa Algorithms | August 2021 - May 2022

- Maintained and optimized a Node.js, MySQL, and Redis backend for a web trading platform and built its integration layer with a MetaTrader 4 server.
- Developed Solana governance programs in Rust, including validator-voting flows; deployed application workloads through Rancher/Kubernetes.

Backend Developer - Node.js

Sobix | May 2018 - August 2021

- Developed a WebTrader backend for forex brokers, adding trailing stops, real-time PnL calculations, and other order-management features.
- Integrated broker APIs and maintained a C++ MetaTrader server plugin used to connect trading terminals with backend services.
- Built Ethereum/Web3.js indexing for a custodial wallet and diagnosed production issues across Node.js, MySQL, and Redis services.

SELECTED PUBLIC WORK

- **OnlyDust-funded contributions | part-time | August 2024 - January 2025:** delivered 25 merged pull requests across 10 public Web3 repositories, spanning Rust and TypeScript tooling, Cairo contracts and tests, account abstraction, chain metadata, and cross-chain infrastructure.
- Implemented [SNIP-9 Outside Execution in starknet . js](#) and [numeric multicall inputs in starknet-foundry](#), taking both changes through upstream review with tests and documentation.
- Upstreamed [four merged changes to Hyperliquid's official Rust SDK](#), resolving production payload and fill-schema mismatches, adding active-asset data, and stabilizing CI/toolchain behavior.
- Built [tgcli](#), an MTPROTO Telegram CLI with a durable local archive, a single-writer background service, machine-readable output, and an optional MCP interface.
- Added a [merged Sway compiler diagnostic](#) for Rust-style enum syntax, including targeted parser errors, actionable suggestions, and regression tests.

EDUCATION

Sevastopol National Technical University

Engineering Diploma in Information Systems and Technologies
